Since 2006 I have been writing software, designed file formats, and classified remote control signals, revolving around infrared remote control and home automation. The old "main project" (old harctoolbox) is the original project. It deals with descriptions of IR protocols and signals, device descriptions, and descriptions of their interconnection.

In early 2011 I came to the conclusion, that my work on IR protocols was a dead end street. It was better to connect to and use the Internet knowledge, notable the so-called IRP notation, that was excellently formalized by Graham Dixon in early 2010. This started the IrpMaster project, in which the IRP notation was completely implemented (with one exception, which is rather a specification flaw than an omission of practical importance).

For IrpMaster, the goal was correctness and completeness, without any compromises for user friendliness. In particular, it does not contain a graphical user interface. Its command line interface appears as inaccessible to the GUI-centered user. Instead, the project IrMaster was started, to allow a user friendly, interactive access to the functionality of IrpMaster. As a graphical "meta program", it also fulfills some other tasks, see its documentation.

Early 2013 I planned to extend IrMaster with more functionality, in particular the possibility to capture IR signals and to import IR signals from many other sources and file formats. Originally, I planned to extend IrMaster with this new functionality; however, I decided to start on a brand new program, IrScrutinizer, which basically combines almost all that fits in an IR program. One of the reasons was that I was unhappy with the somewhat suboptimal code structure of IrMaster. The first version was released on November 2013. IrMaster was declared as no longer developed, promoted to version 1.0.0, which was released in February 2014.

In the light of these projects, the main project harctoolbox has gone slightly "stale", and it needs to be restructured.

The program lirc2xml was posted on the LIRC mailing list in 2009 (without any response :-), and has been residing on my private web page since then. For IrScrutinizer,
I wanted this functionality incorporated. A natural way would be to turn lirc2xml to a shared library with JNI interface. However, discouraged by the experiences from DecodeIR, I wanted a pure Java solution, and ported the part of LIRC needed to parse and interpret the configuration files to Java. This is the Jirc project.

**LIRC CCF**: The idea to modify the LIRC server to allow for directly sent CCF signals was originally sent to me in private mail from Bitmonster (of Eventghost). I made a preliminary version some time later, this was communicated to him and submitted to the then-maintainer Christian Barthelmus, who promptly rejected it (some more details in the documentation). This is its first real "publishing".

There are presently over 80000 lines of source code in Java on this site, code in other languages, or by other authors not counted.

The present work is copyrighted by myself, and available under the GNU General Public License version 3. In the future, it may also be available under additional conditions, so-called dual licensing. (If interested in a commercial license, please contact me.) File formats are in the public domain, including their machine readable descriptions, i.e. DTD and schema files.

As a working project name, as well as in the Java module names, the name Harc, which is simply an acronym for "Home Automation and Remote Control", was used. Unfortunately, that name is far too generic to register as an Internet domain. There is even a Sourceforge project named Harc, (inactive since 2002). For this reason the project was renamed to HARCToolbox early 2011, and the domain [www.harctoolbox.org](http://www.harctoolbox.org) created.

### 2 Overview

**IrpMaster** is a very advanced renderer of infrared signals. That is, from an abstract description consisting of a protocol name, and some parameter values, it computes the corresponding infrared signal, as a sequence of gaps and flashes. It is intended to be used both from its API, as well as an interactive (command line) program, both offline (generating files etc) as well as in real-time applications (generating signals to be sent to hardware equipment). The program does not attempt to be "user friendly", and does not, e.g., contain a graphical user interface. *It is now obsoleted by IrpTransmogrifier.*

**IrpTransmogrifier** is a library and program for IRP notation protocols, with rendering, decoding, analyzing, and code generation applications. This is a new program, written from scratch, that is intended to replace IrpMaster, DecodeIR, and much more. The project consists of an API library that is also callable from the command line as a command line program.
IrMaster’s main purpose is to be a user friendly user interface to IrpMaster. But it does not end there: it also integrates/interfaces with other projects, like the alternative, "classical" IR renderer Makehex, the DecodeIR "inverse renderer", the analyzeIR library, the Harctoolbox main project etc. It can generate export files in different formats, it can address networked hardware directly (presently GlobalCaché, IRTrans LAN module, and a patched LIRC server. (Please note that IrMaster and Irpmaster are two different projects. IrMaster depends on IrpMaster, but not vice versa.) It is now obsoleted by IrScrutinizer.

IrScrutinizer is a powerful program for capturing, generating, analyzing, importing, and exporting of infrared (IR) signals. For capturing and sending IR signals several different hardware sensors and senders are supported. IR Signals can be imported not only by capturing from one of the supported hardware sensors (among others: IrWidget, Global Caché, and Arduino), but also from a number of different file formats (among others: LIRC, Wave, Pronto Classic and professional, RMDU (partially), and different text based formats; not only from files, but also from the clipboard, from URLs, and from file hierarchies), as well as the Internet IR Databases by Global Caché and by IRDB. Imported signals can be decoded, analyzed, edited, and plotted. A collection of IR signal can thus be assembled and edited, and finally exported in one of the many supported formats. In addition, the program contains the powerful IrpMaster IR-renderer, which means that almost all IR protocols known to the Internet community can be generated.

There are some support projects, independent in the sense of a separate package. First, there is the subproject HarcHardware, containing a number of classes for hardware access. This is believed to be of interest also for other projects. Secondly, the subproject GuiComponents (no documentation page present!) contains a number of, in principle, recyclable components, often in the form of Java Beans. Although it was written and conceived as a support project for IrScrutinizer, it is not unlikely that they can be used directly in other programs.

As described in the introduction, the main project is presently slightly "stale".

In the context of the LIRC project, there is a large body of recoded infrared signals in "LIRC format". For many users of home automation and remote control, it would be desirable to use this knowledge outside of the LIRC framework. Unfortunately, the LIRC format (lircd.conf) is is all but well documented. The program lirc2xml therefore uses LIRC itself to decode and export its signals, here to (somewhat arbitrarily) an XML file, that can be further processed.

Finally, the LIRC patch for CCF signals describes an enhancement to the LIRC server.

### 3 Content

- Arduino Nano IR hardware, [part 1](#) and [part 2](#).
- IrScrutinizer, very powerful general purpose IR program.
- IrMaster, a predecessor to IrScrutinizer.
- IrpTransmogrifier, the new IR renderer/decoder/ analyzer.
Welcome to the HARCToolbox project!

- **IrpMaster**, the old and obsolete IR renderer.
- **Glossary and terms**.
- **HarcHardware**, hardware related functionality.
- **Girr, a specification** of a general exchange format for IR signals
- **Generic IR Server**, a specification of a general IR server API
- An annotated list of **IR resources** on the Internet.
- **HarcToolbox**, the old main project.
- **Transforming XML Export from Ir(p)Master**, a tutorial article on generating "interesting stuff" (here, C code) from the XML export. Applies to IrpMaster and IrMaster, not IrScrutinizer, thus somewhat obsolete.
- **Lirc2xml**, a program for extracting IR codes from LIRC files. Predecessor to Jirc, thus obsolete.
- **Improved lirc driver** for the Raspberry Pi.
- **Raspberry Pi daughter board for IR and RF** transmission and reception.
- **LIRC CCF patch**, to make the LIRC server more usable.
- **Relationship to other, similar projects**.
- **Downloads**, mostly obsolete.

4 Other links

- **IrScrutinizer tutorial**. Aimed at the beginner and quite easy to read.
- **SB-Projects' IR Remote Control Theory**. A very good place to start leaning about IR protocols. Covers the basics of infrared signals, and its modulation. Not too long, not too "dummy"-oriented.
- **JP1 wiki**. Many articles, of different ages and qualities, are collected here.
